Executive Summary — Deterministic Recovery and the $124B Opportunity

Powered by Beyond-Truth

From $2.9T in Claims to ~$124B in Recoverable Economic Value

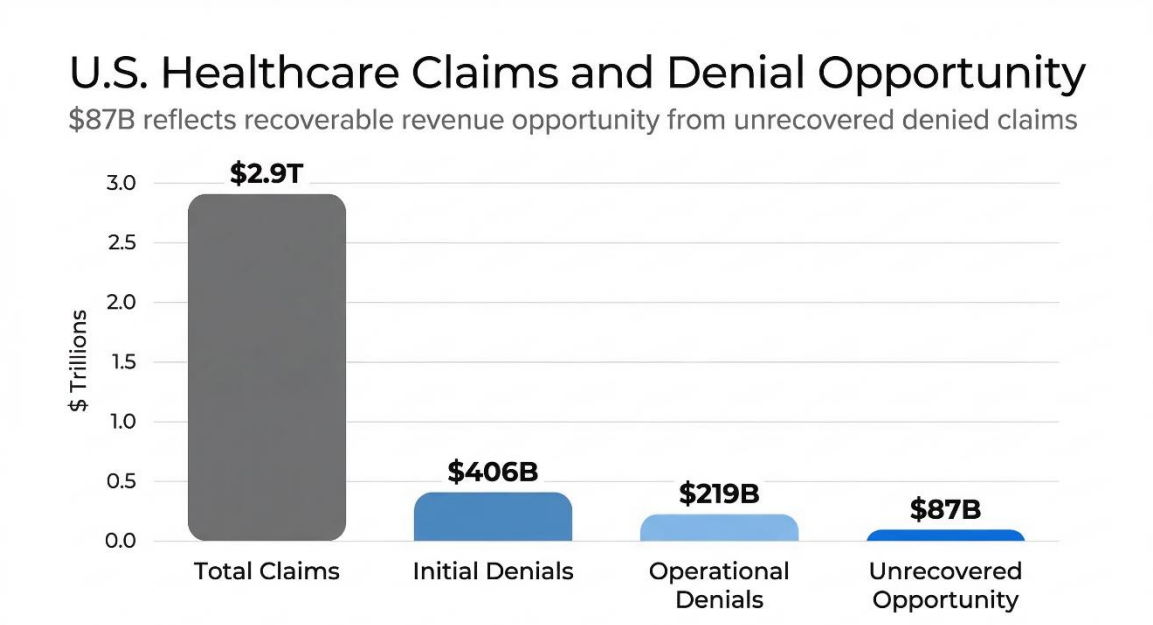
The U.S. healthcare system processes approximately **$2.9 trillion in annual claims**, yet a significant portion of that revenue is systematically delayed, reworked, or lost due to manual workflows, fragmented data, and payer-driven adjudication cycles.

Within the current system:

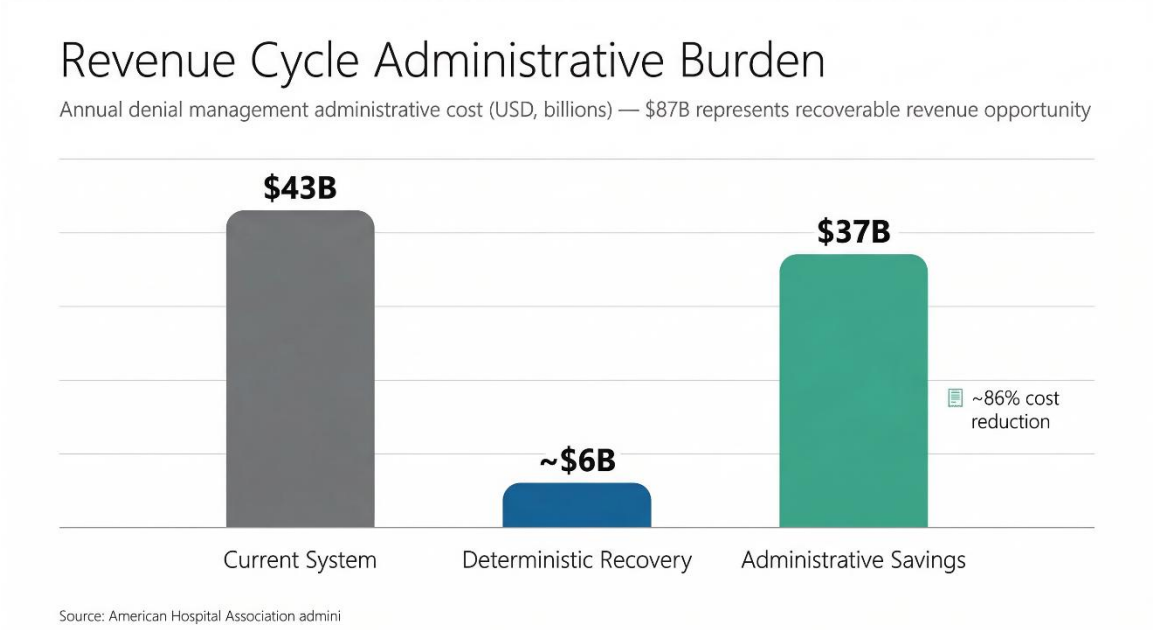
- **~$406B** are initially denied
- **~$219B** require manual operational review
- **~$87B** are ultimately written off or never recovered
- Providers spend **~$43B annually** managing denials and payment friction
- Even when **84% of claims** are paid or partially paid on first submission, providers still incur **~5–8% RCM fees**

This is a structurally inefficient system where revenue is:

Delayed → Reworked → Lost → Charged Without Intervention



The Defined $124B Economic Opportunity



This opportunity is measurable, repeatable, and composed of two distinct and additive components:

1. Revenue Recovery — ~$87B annually

- Recoverable denied and underpaid claims
- Equivalent to:
  - **~$14.3M per hospital** across ~6,100 hospitals
  - **$100M to $1B+ annually** for large health systems

---

2. Administrative Cost Reduction — ~$37B annually

- Current administrative burden: **~$43B**
- Deterministic modeled burden: **~$6B**

Total Economic Impact

This represents one of the largest immediately addressable financial opportunities in the U.S. healthcare system.

$87B recoverable revenue

+ $37B administrative cost reduction

= ~$124B total economic impact

This delivers:

- direct revenue recovery for providers
- structural cost reduction across the revenue cycle

Strategic Context
The ~$124B annual economic impact is **comparable to — and in some scenarios exceeds — the combined net income of the largest U.S. health insurers.**

What Deterministic Recovery Delivers

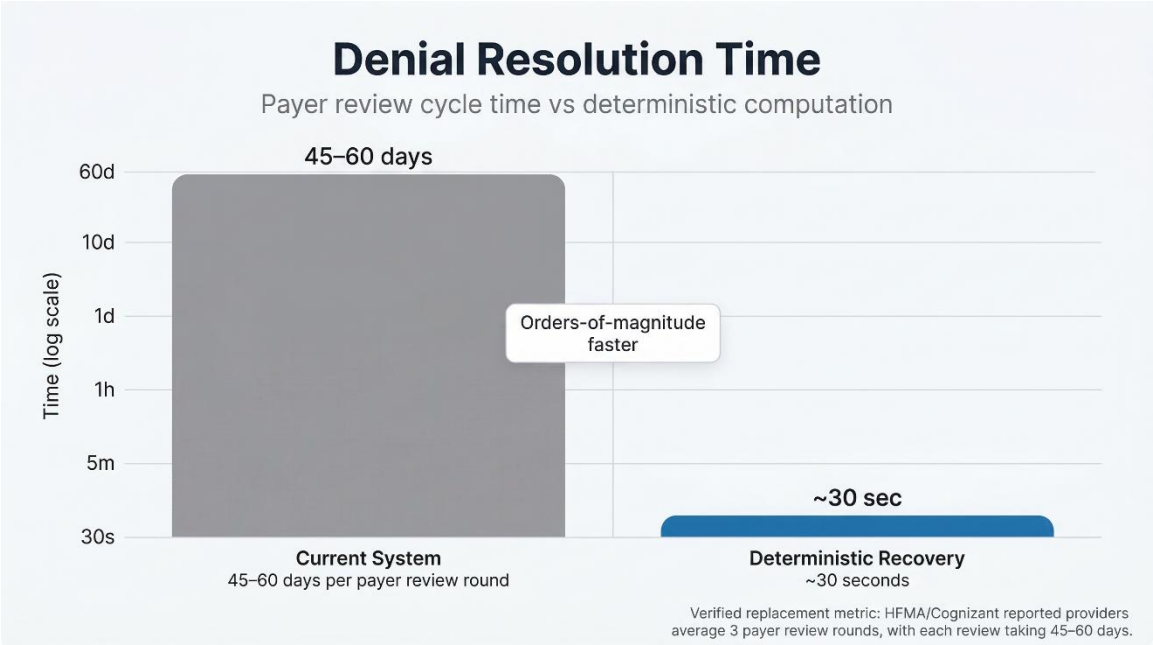
Deterministic recovery introduces a new category of claim adjudication — **computational, auditable, and repeatable**.

It replaces subjective workflows with:

- Service-line level validation of expected payment
- Identification of underpayments and denial drivers
- Automated correction and resubmission
- Consistent, auditable financial outcomes

This is not labor efficiency — it is a **structural shift from manual workflows to computational adjudication**.

Operational Transformation



Current State

- 45–60 day payer review cycles
- Multiple appeal rounds
- Prolonged back-and-forth between providers and payers
- Large administrative teams managing denials

With Deterministic Recovery

- Claim validation and correction in **seconds to minutes**
- Resolution cycles reduced from **weeks → hours (or same day)**
- Significant reduction in administrative workload
- Elimination of repetitive manual processes

RCM Cost Compression

Providers currently pay **~5–8% of total collections** across all claims — including those requiring little or no rework.

Deterministic processing reduces this by:

- Automatically validating payment accuracy
- Identifying discrepancies without human review
- Eliminating unnecessary rework cycles

Result:

- Reduced internal staffing requirements
- Reduced reliance on outsourced RCM vendors
- **~3–6% reduction in total RCM costs**

Historical Recovery — Unlocking the Past

For the first time, providers can:

- Analyze historical 835 remittance data at scale
- Identify underpayments and missed adjudications
- Resubmit previously denied or underpaid claims

This enables recovery of **years of previously lost revenue**, not just future claims.

Why This Is Now Possible

Healthcare claim resolution has historically been constrained by:

- Fragmented 837 (claims) and 835 (remittance) data
- Manual interpretation of payer adjudication
- Lack of computational reconciliation between expected vs actual payment

The Deterministic Recovery Platform unifies:

- 837 + 835 data intelligence
- Service-line level financial modeling
- Deterministic adjudication logic
- Auditable, repeatable workflows

This enables a level of **precision, consistency, and scale not previously achievable**.

At scale, this enables providers to independently validate financial outcomes — in many cases identifying discrepancies beyond payer adjudication accuracy.

Deterministic recovery converts claim adjudication from a payer-controlled process into a measurable, data-driven financial outcome.

Market Impact and Competitive Shift

Providers

- Recover tens of millions to billions annually
- Reduce administrative overhead
- Accelerate cash flow

RCM Companies

- Transition from labor-based models to automation-driven platforms
- Improve margins and scalability
- Capture disproportionate market share

Payers

- Increased pressure on denied claims
- 835 remittance data enables providers to:
  - Validate adjudication outcomes
  - Challenge denials with precision
  - **In many cases demonstrate more accurate financial outcomes than payer determinations**

This shifts claim resolution from subjective workflows to **data-driven validation**.

Market Inevitability

As deterministic recovery is adopted, claim resolution transitions from a subjective process to a measurable financial outcome.

This shift:

- reduces reliance on manual workflows
- compresses administrative cost structures
- increases recoverable revenue across providers

Over time, this transition is expected to **redefine revenue cycle economics across providers, RCM vendors, and payers**.

The Bottom Line

For the first time, the financial outcome of every claim can be:

computed → validated → corrected → recovered

Deterministic recovery transforms healthcare payments from:

manual → delayed → inconsistent

into:

automated → auditable → financially precise
